

Deprecation of REST API v1.x

TECHNICAL ADVISORY: API DEPRECATION NOTICE

Affected Service: Crestview Object Storage API (v1.0 - v1.4) Announcement Date: August 18, 2026 End of Life (EOL) Date: February 28, 2027

Overview: As part of our ongoing commitment to security and performance, Crestview Cloud Services is officially announcing the deprecation of the Object Storage REST API v1.x series. All customers currently integrating with these endpoints must migrate their applications to the GraphQL-based API v2.0 prior to the End of Life (EOL) date.

Why is v1.x being deprecated? The v1.x architecture relies on outdated XML payload parsing and utilizes TLS 1.1 for transport layer security. These protocols no longer meet our stringent internal security baselines. Furthermore, the synchronous nature of the v1.x bulk-upload endpoints has proven to be a bottleneck for customers handling datasets larger than 500GB.

Migration Path: The v2.0 GraphQL API offers a 60% reduction in query payload size and supports asynchronous, chunked multipart uploads. Comprehensive migration documentation, including mapping tables for REST to GraphQL mutations, is available at `docs.crestview.test/migration/v2``.

Timeline of Events: - September 1, 2026: No new features or non-critical bug fixes will be deployed to v1.x endpoints. - December 1, 2026: Brownout testing begins. We will intentionally fail 5% of v1.x requests with an HTTP 410 Gone status to highlight remaining legacy integrations. - February 28, 2027: Complete shutdown. All calls to ``api.crestview.test/v1/*`` will return an HTTP 404 Not Found.

Please reach out to your Technical Account Manager if you require assistance evaluating your current API usage metrics.
