

Release Notes: Omni-Stream Enterprise v5.1

RELEASE NOTES: OMNI-STREAM DATA ANALYTICS V5.1

Date: August 18, 2026 Product: Omni-Stream Enterprise Company: Zenith Horizon Technologies

Overview: We are excited to announce the general availability of Omni-Stream v5.1. This release introduces major enhancements to our predictive forecasting module, expands third-party API support, and resolves several performance bottlenecks identified in the v5.0 launch.

New Features & Enhancements: - Predictive Resource Modeling (PRM): We have integrated a new machine learning engine into the dashboard. Users can now forecast server bandwidth requirements up to 90 days in advance based on historical ingress/egress patterns. - Expanded Webhook Integrations: Users can now configure custom webhooks to trigger alerts directly into Slack, Microsoft Teams, and PagerDuty when an ingestion pipeline exceeds user-defined latency thresholds. - Dynamic Payload Parsing: The ingestion engine now supports dynamic JSON payload structures, eliminating the need to hardcode schema definitions for every new IoT device type.

Performance Improvements: - Optimized the time-series database query compiler, resulting in a 40% reduction in dashboard loading times for queries spanning datasets larger than 1 terabyte. - Reduced memory consumption of the background sync daemon by optimizing garbage collection cycles.

Bug Fixes: - Fixed an issue (TKT-9912) where scheduled PDF reports would occasionally fail to render embedded charts if the dataset contained null values. - Resolved a memory leak (TKT-9944) in the legacy SOAP integration layer that caused periodic service restarts. - Fixed a UI bug where the dark mode toggle would not persist across browser sessions.

Deprecations: As previously announced, support for TLS 1.1 has been officially removed in this release. All API clients must negotiate connections using TLS 1.2 or higher. The legacy v2 REST endpoints have been marked as deprecated and will be permanently shut down in the v6.0 release scheduled for Q1 2027. We strongly advise migrating all scripts to the v3 GraphQL API.
