

Server End-of-Life (EOL) Decommissioning Plan

HARDWARE DECOMMISSIONING AND DATA DESTRUCTION PLAN

Facility: Ironwood Chicago DC-2 Asset Class: 45x Dell PowerEdge R730 Rack Servers Project Lead: Marcus Vance, Data Center Operations Target Completion: September 5, 2026

Background: The aforementioned 45 Dell PowerEdge servers, housed in Racks C12 through C15, have reached the end of their 5-year hardware lifecycle and extended vendor warranty period. All active workloads have been successfully migrated to the new AMD EPYC-based clusters. These legacy assets must now be safely powered down, sanitized, and physically recycled.

Decommissioning Procedure:

Step 1: Network Isolation and Power Down - Disable all associated switch ports on the Top-of-Rack (ToR) switches to prevent accidental network reconnection. - Gracefully power down the operating systems via iDRAC management interfaces. - Disconnect and label all twinax DAC cables and dual-redundant power supplies.

Step 2: Storage Media Sanitization - Due to compliance requirements regarding customer PII, simple logical deletion is insufficient. - Data center technicians will physically extract all 360 SAS SSD and HDD drives from the server chassis. - All drives will be processed through a localized degaussing machine (for HDDs) or subjected to cryptographic erasure (for SSDs). - Post-sanitization, all drives will be placed in a secure lockbox pending physical destruction.

Step 3: Physical Destruction and E-Waste Disposal - On September 3, a certified third-party vendor (EcoShred Logistics) will arrive on-site with a mobile industrial shredder. - All 360 drives will be physically shredded to pieces no larger than 2mm, rendering data recovery impossible. - The vendor will issue a Certificate of Destruction (CoD) referencing the serial number of every destroyed drive. - The empty server chassis and associated copper cabling will be transported by the vendor to a certified e-waste recycling facility.

Asset Management: Upon receipt of the CoD, the IT Asset Management (ITAM) database will be updated to reflect the status of these assets as "Destroyed/Recycled."
